Office Action Summary

Application No.

09/834,160

Applicant(s)

BURFEIND ET AL.

Examiner

Ashok B. Patel

Art Unit

2154

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 June 2005.
2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-80 is/are pending in the application.
4a) Of the above claim(s) 1-19 and 48-61 is/are withdrawn from consideration.
5) ☐ Claim(s) _____ is/are allowed.
6) ☒ Claim(s) 28-47 and 62-80 is/are rejected.
7) ☐ Claim(s) _____ is/are objected to.
8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____.
4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
5) ☐ Notice of Informal Patent Application (PTO-152)
6) ☐ Other: _____.

DETAILED ACTION

1. Claims 20-80 are subject to examination. Claims 1-19 and 48-61 have been cancelled.

Continued Examination Under 37 CFR 1.114

2. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 06/13/2005 has been entered.

Response to Arguments

3. Applicant's arguments filed 06/13/2005 have been fully considered but they are not persuasive for the following reasons and teachings of the prior art.

Applicant's argument: Claim 28

"The method further includes transmitting the customized weather map to the wireless client device and displaying the customized weather map. Therefore, Obradovich does not anticipate or suggest claim 28 for at least the same reasons as discussed above with respect to claim 20."

Examiner's response:

Claim 28 recites:

"Obtaining the weather map data from a source of weather map data;

producing a new customized weather map data by processing the weather map data on the server for a geographic region surrounding the geographic point of interest, wherein the customized weather map is one of multiple image types producible by the server; “ while claim 20 recites:

“to obtain map data corresponding to the geographic point of interest in response to the user input, to obtain weather data for a geographic region surrounding the geographic point of interest from the source of weather data in response to user input. to create a new customized weather map by combining the map data with the weather data.”

As such, and as claimed in claim 28, Obradovich teaches “(col.2, lines 39-41, “The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.”, Abstract, “The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.” , Fig. 32, col. 12, lines 27-30, “The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.”

Applicant’s argument: Claim 34

“The client software includes a zoom-in or zoom-out command allowing the user to dynamically modify the range of the map displayed on the wireless client device. The server system includes server software for producing customized weather maps providing zoom-in or zoom-out features.”

Examiner's response:

Obradovich teaches Col. 10, line 64 through col. 11, line 11, "The dynamic nature of the PCD allows the PCD to display GPS encoded maps as the PCD progresses dynamically with relation to the maps. (17) Using interpolation techniques, performing spatial query analysis, and establishing layers for best display scale for any given map record allows the device to provide the user extended capability not possessed by traditional GPS devices. Applying various protocols and interpolation techniques allow files to be arranged geographically by distance from a designated point (usually the requesters latitude and longitude as the starting point, but other locations may also be used). The maps are also arranged in layers, menus, limited, listed, showed, displayed, and sorted."

Applicant's argument: Claim 42

"The zoom-in and zoom-out commands dynamically change the range of the customized weather maps on the wireless client. Therefore, for at least the same reasons as discussed above with respect to claim 34, Obradovich does not anticipate or suggest claim 42."

Examiner's response:

Please refer to the response provided for claim 34.

Applicant's argument: Claim 62

"Obradovich fails to disclose or suggest a PCD receiving a request for weather map data, producing a customized weather map, and transmitting the customized weather map to another PCD. Therefore, for at least these reasons, Obradovich doe's

not anticipate or suggest claim 62.”

Examiner’s response:

Claim 62 recites “to receive a server request for weather map data for the geographic point of interest, to produce a customized weather map by processing weather map data from the source of weather map data for a geographic region surrounding the geographic point of interest, to transmit the customized weather map to the wireless client device, and Obradovich teaches in “Abstract and col.2, lines 39-41, Fig.11, “Note: PCD is also a server to another PCD.”, and in col.8, lines 20-30, “The microprocessor may also access or control communications with telephone networks, either hardwired or cellular, radio transmissions, infra-red transmissions, or communications with other computer devices. All known verbal commands from GPS systems can be implemented and attachment or inclusion of voice activation for map instructions relative to location (estimate a current location of the wireless client device), GPS and street designations, including heading descriptions, distance, and arrival time estimates can be included.”

Applicant’s argument: Claim 74

“Obradovich fails to disclose or suggest generating a customized weather map on a server.”

Examiner’s response:

Please refer to the following rejection for claim 74.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 20-27 and 74-80 are rejected under 35 U.S.C. 103(a) as being unpatentable over Obradovich et al. (hereinafter Obradovich)(US 6, 529, 824) in view of Chuang (US 2002/0113826 A1) .

Referring to claim 20,

Obradovich teaches a computerized system (Fig.2) for producing a customized weather map from a source of weather map data for a geographic area (Fig.32 and Abstract), the computerized system comprising:

a wireless client device (Fig.4, col.8, lines 20-24) including

an input device receiving commands and data from a user (Fig.4, elements 26,27,28B);

a graphical display having a center point substantially centered in the graphical display (Fig.4, element 28A, Fig.2, elements 28,30);

a processor (Fig.4, element "processor"); and
client software executable by the processor to receive user input from the input device (Fig.32), to generate a server request for weather map data corresponding to a geographic point of interest in response to user request (Fig.32, elements "City, State, ZIP code, area code etc), and display a customized weather map (col.12, lines 26-30)

Art Unit: 2154

for a geographic region surrounding the geographic point of interest, wherein the geographic point of interest is substantially aligned with the center point of the graphical display (Fig.32, element "center map by", col.12, lines 20-34); and a server system coupled to receive weather map data from the source of weather map data, the server system including:

one or more computing platforms; and

server software executable by the server system to receive the server request for weather map data for the geographic point of interest, process weather map data from the source of weather map data for a geographic region surrounding the geographic point of interest to produce a customized weather map, and transmit the customized weather map to the wireless client device, wherein the customized weather map is one of multiple image types producible by the server system. (col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.", Fig. 32, col. 12, lines 27-30, "The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.",)

However, Obradovich fails to specifically teach the server "to obtain map data corresponding to the geographic point of interest in response to the user input. to obtain weather data for a geographic region surrounding the geographic point of interest from

the source of weather data in response to user input. to create a new customized weather map by combining the map data with the weather data.

Chuang teaches exactly what is lacking by Obradovich, as being in para.[0064], "the converted weather data 308 is processed in the processor 104 with the map data, S210, so as to form complete image data, which represents a combination of the map data and weather data. Once the composite image data is generated, in step S212, the composite image data is sent to display 112 for viewing by the user."

Therefore, it would have been obvious to one having ordinary skill in the art at the time of invention was made to implement the teachings of the Chuang in the server feeding the PCD of Obradovich such that the weather maps of the geographic point of interest can be readily delivered to the PCD.

Referring to claim 21,

Obradovich teaches the computerized system, wherein the wireless client device comprises a wireless-application protocol-enabled mobile phone. (col.2, lines 60-64)

Referring to claim 22,

Obradovich teaches the computerized system, wherein the wireless client device comprises a personal digital assistant adapted for wireless Internet access. (Fig.4, col.2, lines 60-64)

Referring to claim 23,

Obradovich teaches the computerized system, wherein the geographic point of interest is a current location of the wireless client device. (col.11, lines 38-52," Maps from an external source are downloaded via any of the communication links such as the FAX,

Art Unit: 2154

BEEPER, PHONE or RADIO touch points provided in the sub-menu portion of the display 151. Depending on the users requirements, several maps could exist showing similar map areas with different layers for viewing. By way of example, airport maps with air space requirements, coastal waterway, maps, and interstate maps, and even hand drawn maps scanned into a computer system all show different resources within a given geographic area. These maps, when presented on the PCD, could over-saturate the display map detail for any given map area. Therefore, it is preferred that the actual map displayed be selectable. Maps are retrieved by pressing QUE IN 550, scrolling to highlight the desired map, and pressing ENTER 27g FIG. 2.”).

Referring to claim 24,

Obradovich teaches the computerized system, wherein the server software is further executable by the server system to determine the current location of the wireless client device by receiving location information from a global positioning system. (col.2, lines 60-63, Fig.11, “Note: PCD is also a server to another PCD.”, Fig.7, col.10, lines 20-34,

Referring to claim 25,

Obradovich teaches the computerized system, wherein the server software is further executable by the server system to determine the current location of the wireless client device by determining a cell of the wireless client device. (col.2, lines 60-63)

Referring to claim 26,

Obradovich teaches the computerized system, wherein the server software is further executable by the server system to determine the current location of the wireless client

Art Unit: 2154

device by receiving location information from user-entered data. (Fig. 32, col.12, lines 20-34)

Referring to claim 27,

Obradovich teaches the computerized system, wherein the source of weather map data is a ground-based source. (Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.")

Referring to claims 74 and 78,

Obradovich teaches a computerized method for producing a customized weather map from at least one source of weather map data for a geographic point of interest of a user, the computerized method comprising:

sending a request from a client device to a server for weather map data corresponding to a geographic point of interest of a user and transmitting the customized weather map to the wireless client device; and displaying the customized weather map for the geographic region surrounding the geographic point of interest on a graphical display of the wireless client device. (col. 12, line 2-34).

However, Obradovich fails to specifically teach the server obtaining a base map including geographic information corresponding to the geographic point of interest of the user from a first source; obtaining geo-temporal data corresponding to the base map from a second source; producing a first customized weather map for the geographic point of interest of a user by combining the geo-temporal data and the base map on the server, and wherein the geo-temporal data is a graphic image.

Chuang teaches exactly what is lacking by Obradovich, as being in para.[0059] [0064] and [0065], "the converted weather data 308 is processed in the processor 104 with the map data, S210, so as to form complete image data, which represents a combination of the map data and weather data. Once the composite image data is generated, in step S212, the composite image data is sent to display 112 for viewing by the user."

Therefore, it would have been obvious to one having ordinary skill in the art at the time of invention was made to implement the teachings of the Chuang in the server feeding the PCD of Obradovich such that the weather maps of the geographic point of interest can be readily delivered to the PCD.

Referring to claims 75, 79 and 80,

Keeping in mind the teachings of Obradovich, Obradovich fails to specifically teach obtaining geo-political data; and combining the geo-political data with the first customized weather map to produce a second customized weather map including geographical, geo-temporal, and geo-political information, and wherein the geo-political data is a graphic image, and wherein the predetermined personal locations of interest to the user are represented as graphic images.

Chuang teaches exactly what is lacking by Obradovich, as being in para.[0059] [0064] and [0065], "the converted weather data 308 is processed in the processor 104 with the map data, S210, so as to form complete image data, which represents a combination of the map data and weather data. Once the composite image data is

Art Unit: 2154

generated, in step S212, the composite image data is sent to display 112 for viewing by the user.”

Therefore, it would have been obvious to one having ordinary skill in the art at the time of invention was made to implement the teachings of the Chuang in the server feeding the PCD of Obradovich such that the weather maps of the geographic point of interest can be readily delivered to the PCD.

Referring to claim 76,

Obradovich teaches the computerized method of claim 74, further comprising: obtaining predetermined personal locations of interest to the user; and modifying the first customized weather map to include the predetermined personal locations of interest to the user. (col. 12, line 20-34)

Referring to claim 77,

Obradovich teaches the computerized method of claim 76, wherein the predetermined personal locations includes at least one of names, longitude and latitude locations, and keys into lists or tables of personal location that are stored on the server. (col. 4, line 16-32).

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an

international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

7. Claims 28–47 and 62-73 are rejected under 35 U.S.C. 102(e) as being anticipated by Obradovich et al. (hereinafter Obradovich)(US 6, 529, 824).

Referring to claim 28,

Obradovich teaches a computerized method for producing a customized weather map for a geographic area (Abstract and Fig.32), the computerized method comprising:

 sending a request to a server for weather map data corresponding to a geographic point of interest of a user (Fig.4, Fig.32, col.8, lines 20-24);

 Obtaining the weather map data from a source of weather map data;

 producing a new customized weather map data by processing the weather map data on the server for a geographic region surrounding the geographic point of interest (Fig.32, elements "City, State, ZIP code, area code etc), wherein the customized weather map is one of multiple image types producible by the server system. (col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD." , Fig. 32, col. 12, lines 27-30, "The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.")

 transmitting the customized weather map to the wireless client device; and

displaying the customized weather map for the geographic region surrounding the geographic point of interest on a graphical display of the wireless client device(col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD."), wherein the geographic point of interest is substantially aligned with a center point of the graphical display (Fig.32, element "center map by", col. 12, lines 20-34).

Referring to claims 29 and 43,

The reference teaches the computerized method, further comprising determining the geographic point of interest of the user (Fig.32, elements "City, State, ZIP code, area code etc.)

Referring to claims 30 and 44,

The reference teaches the computerized method, wherein the determining of the geographic point of interest of the user comprises determining a current location of the wireless client device. (Fig.8, col.10, lines 36-40)

Referring to claims 31, 45 and 71,

The reference teaches the computerized method, wherein the determining of the current location of the wireless client device comprises determining a cell of the wireless client device. (Fig 1, col.7, lines 20-30, col.12, lines 60-63)

Referring to claims 32, 46 and 72,

The reference teaches the computerized method, wherein the determining of the current location of the wireless client device comprises receiving location information from a global positioning system. (col.2, lines 60-63, Fig.7, col.10, lines 20-34).

Referring to claims 33, 47 and 73,

The reference teaches the computerized method, wherein the determining of the current location of the wireless client device comprises receiving location information from user-entered data. (Fig. 32, col.12, lines 20-34)

Referring to claim 34,

The reference teaches a computerized system for producing a customized weather map having a range from a source of weather map data for a geographic area, the computerized system (Fig.32, Abstract) comprising:

- a wireless client device including

- an input device receiving commands and data from a user; (Fig.4, elements 26,27,28B)

- a graphical display having a center point substantially centered in the graphical display (Fig.4, element 28A, Fig.2, elements 28,30);

- a processor (Fig.4, element "processor"); and

- client software executable by the processor to receive user input from the input device including a zoom-in or zoom-out command for dynamically changing the range of the customized weather map, generate a server request for weather map data corresponding to a geographic point of interest, and display the customized weather map for a geographic region surrounding the geographic point of interest,

wherein the geographic point of interest is substantially aligned with the center point of the graphical display (Fig. 32; and

a server system coupled to receive weather map data from the source of weather map data, the server system comprising:

one or more computing platforms; and

server software executable by the server system to receive a server request for weather map data for the geographic point of interest, to process weather map data from the source of weather map data for a geographic region surrounding the geographic point of interest (Fig.32, elements "City, State, ZIP code, area code etc), to produce a plurality of customized weather maps, one or more of the customized weather maps providing a zoom-in or zoom-out feature for dynamically changing the range of the customized weather map on the wireless client device (col.12, lines 26-30), and to transmit one or more of the customized weather maps in response to the server request, wherein the customized weather map is one of multiple image types producible by the server system. (col.12, lines 20-34, "FIG. 32 illustrates a Weather Map Request page. The Weather Map Request page is accessed by pressing the Weather button 27n (shown in FIG. 2) on the PCD. The Weather Map Request page allows the PCD user to specify the map location and scale (zoom-in or zoom-out views), the map type, whether the selected map should be automatically updated at specified intervals, and whether a set of maps should be displayed in a sequential fashion. The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of

Art Unit: 2154

weather map available. Some weather information is more perfectly provided by showing a sequence of displays indicating the change in weather over time. wherein the customized weather map is one of multiple image types producible by the server system. Therefore, the PCD allows the operator to sequentially display a set of maps, thus providing an animated map display.”, col.2, lines 39-41, “The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.”, Abstract, “The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.”, Fig. 32, col. 12, lines 27-30, “The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.”, col. 16, line 17-19, “As shown in FIG. 21, the PCD can use any scale of map or combinations and other types of maps as shown.”)

Referring to claims 35 and 63,

Obradovich teaches the computerized system, wherein the wireless client device comprises a wireless-application protocol-enabled mobile phone. (col.2, lines 60-64)

Referring to claims 36 and 64,

Obradovich teaches the computerized system, wherein the wireless client device comprises a personal digital assistant adapted for wireless Internet access. (Fig.4, col.2, lines 60-64)

Referring to claims 37 and 65,

Art Unit: 2154

Obradovich teaches the computerized system, wherein the geographic point of interest is a current location of the wireless client device. (col.11, lines 38-52," Maps from an external source are downloaded via any of the communication links such as the FAX, BEEPER, PHONE or RADIO touch points provided in the sub-menu portion of the display 151. Depending on the users requirements, several maps could exist showing similar map areas with different layers for viewing. By way of example, airport maps with air space requirements, coastal waterway, maps, and interstate maps, and even hand drawn maps scanned into a computer system all show different resources within a given geographic area. These maps, when presented on the PCD, could over-saturate the display map detail for any given map area. Therefore, it is preferred that the actual map displayed be selectable. Maps are retrieved by pressing QUE IN 550, scrolling to highlight the desired map, and pressing ENTER 27g FIG. 2.").

Referring to claims 38 and 66,

Obradovich teaches the computerized system, wherein the server software is further executable by the server system to determine the current location of the wireless client device by receiving location information from a global positioning system. (col.2, lines 60-63, Fig.11, "Note: PCD is also a server to another PCD.", Fig.7, col.10, lines 20-34,

Referring to claims 39 and 67,

Obradovich teaches the computerized system, wherein the server software is further executable by the server system to determine the current location of the wireless client device by determining a cell of the wireless client device. (col.2, lines 60-63)

Referring to claims 40 and 68,

Art Unit: 2154

Obradovich teaches the computerized system, wherein the server software is further executable by the server system to determine the current location of the wireless client device by receiving location information from user-entered data. (Fig. 32, col.12, lines 20-34)

Referring to claims 41 and 69,

Obradovich teaches the computerized system, wherein the source of weather map data is a ground-based source. (Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.")

Referring to claim 42,

The reference teaches a computerized method for producing a customized weather map from a source of weather map data for a geographic area, the computerized method (Fig.32 and Abstract) comprising:

 sending a request to a server for weather map data corresponding to a geographic point of interest of a user (Fig.4, Fig.32, col.8, lines 20-24);

 processing weather map data on the server from the source of weather map data; producing a plurality of customized weather maps for a geographic region surrounding the geographic point of interest, wherein the customized weather map is one of multiple image types producible by the server system. (Fig.32, elements "City, State, ZIP code, area code etc", col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using

searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.”, Fig. 32, col. 12, lines 27-30, “The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.”);

transmitting one or more of the customized weather maps to a wireless client device, at least one of the customized weather maps providing a zoom-in or zoom-out feature for dynamically changing a range of the customized weather map on the wireless client device to one of a plurality of other ranges in response to a zoom-in or zoom-out command;

displaying one of the customized weather maps having a range for the geographic region surrounding the geographic point of interest on a graphical display of the wireless client device, wherein the geographic point of interest is substantially aligned with a center point of the graphical display; processing a zoom-in or zoom-out command on the wireless client device; and displaying the customized weather map having one of the plurality of other ranges for the geographic region surrounding the geographic point of interest of the graphical display of the wireless client device. .

(col.12, lines 20-34, “FIG. 32 illustrates a Weather Map Request page. The Weather Map Request page is accessed by pressing the Weather button 27n (shown in FIG. 2) on the PCD. The Weather Map Request page allows the PCD user to specify the map location and scale (zoom-in or zoom-out views), the map type, whether the selected map should be automatically updated at specified intervals, and whether a set of maps

Art Unit: 2154

should be displayed in a sequential fashion. The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available. Some weather information is more perfectly provided by showing a sequence of displays indicating the change in weather over time. Therefore, the PCD allows the operator to sequentially display a set of maps, thus providing an animated map display.” and col. 16, line 17-19, “As shown in FIG. 21, the PCD can use any scale of map or combinations and other types of maps as shown.”)

Referring to claim 62,

The reference teaches a computerized system for producing a customized weather map from a source of weather map data for a geographic area, the computerized system (Fig.32 and Abstract) comprising:

- a wireless client device (Fig.4) including

- an input device receiving commands and data from a user (Fig.4, elements 26,27,28B);

- a graphical display having a center point substantially centered in the graphical display (Fig.32, element “center map by”, Fig.4, element 28A, Fig.2, element 28,30);

- a processor (Fig.4, element “processor”); and

- client software executable by the processor to receive user input from the input device (Fig.32), generate a server request for weather map data corresponding to a geographic point of interest (Fig.32, elements city, state, ZIP code,

Art Unit: 2154

area code etc.), display a customized weather map for a geographic region surrounding the geographic point of interest, wherein the geographic point of interest is substantially aligned with the center point of the graphical display (Fig.32, element "center map by"), and display customized weather data associated with a weather condition of interest (col.12, lines 20-34); and

a server system coupled to receive weather map data from the source of weather map data (Abstract), the server system comprising:

one or more computing platforms; and

server software executable by the server system (Fig.11, "Note:PCD is also a server to another PCD.", or col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD." , Fig. 32, col. 12, lines 27-30, "The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.") to receive a server request for weather map data for the geographic point of interest, to produce a customized weather map by processing weather map data from the source of weather map data for a geographic region surrounding the geographic point of interest, to transmit the customized weather map to the wireless client device (Abstract and col.2, lines 39-41), estimate a current location of the wireless client device, to estimate a speed and direction of movement of the

Art Unit: 2154

wireless client device, to estimate a time of arrival of the wireless client device to a weather condition of interest to the user, and to transmit to the wireless client device customized weather data associated with the weather condition of interest, wherein the customized weather map is one of multiple image types producible by the server system (Fig.11, "Note: PCD is also a server to another PCD.", col.8, lines 20-30, "The microprocessor may also access or control communications with telephone networks, either hardwired or cellular, radio transmissions, infra-red transmissions, or communications with other computer devices. All known verbal commands from GPS systems can be implemented and attachment or inclusion of voice activation for map instructions relative to location (estimate a current location of the wireless client device), GPS and street designations, including heading descriptions, distance, and arrival time estimates can be included." (estimate a speed and direction of movement of the wireless client device, estimate a time of arrival of the wireless client device), col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.", Fig. 32, col. 12, lines 27-30, "The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.").

Referring to claim 70,

The reference teaches a computerized method (Fig.2) for producing a customized weather map from a source of weather map data for a geographic area (Fig.32 and Abstract) , the computerized method comprising:

- sending a request to a server for a particular type of weather map data corresponding to a geographic point of interest of a user (Fig.4, Fig.32, col.8, lines 20-24);

- obtaining the particular type of weather map data from the source of weather map data; (col. 12, line 20-34)

- creating a customized weather map by processing the weather map data on the server for a geographic region surrounding the geographic point of interest, wherein the customized weather map is one of multiple image types producible by the server system (Fig.32, elements "City, State, ZIP code, area code etc", col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD." , Fig. 32, col. 12, lines 27-30, "The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.");

- transmitting the customized weather map to the wireless client device;
- displaying the customized weather map for the geographic region surrounding the

Art Unit: 2154

geographic point of interest on a graphical display of the wireless client device (col.2, lines 39-41), the geographic point of interest being substantially aligned with a center point of the graphical display (Fig.32, element "center map by");

estimating a current location of the wireless client device on the server, estimating a speed and direction of movement of the wireless client device on the server; estimating a time of arrival of the client device to a weather condition of interest to the user on the server;

transmitting customized weather data associated with the weather condition of interest to the wireless client device; and displaying the customized weather data associated with the weather condition of interest on the graphical display of the wireless client device. (Fig.11, "Note: PCD is also a server to another PCD.", col.2, lines 39-41, "The system accesses computer and storage systems with various applications in order to provide this information from a plurality of providers.", Abstract, "The data providers respond to requests by using searching and sorting schemes to interrogate data bases and then automatically transmitting data responsive to the requests to the requesting PCD.", Fig. 32, col. 12, lines 27-30, "The PCD displays a number of different types of weather maps, including satellite images, radar maps, temperature maps, wind chill maps, and any other type of weather map available.", col.8, lines 20-30, "The microprocessor may also access or control communications with telephone networks, either hardwired or cellular, radio transmissions, infra-red transmissions, or communications with other computer devices. All known verbal commands from GPS systems can be implemented and attachment or inclusion of voice activation for map

instructions relative to location (estimate a current location of the wireless client device), GPS and street designations, including heading descriptions, distance, and arrival time estimates can be included.” (estimating a current location of the wireless client device, estimating a speed and direction of movement of the wireless client device; estimating a time of arrival of the client device)).

Conclusion

Examiner’s note: Examiner has cited particular columns and line numbers in the references as applied to the claims above for the convenience of the applicant.

Although the specified citations are representative of the teachings of the art and are applied to the specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ashok B. Patel whose telephone number is (571) 272-3972. The examiner can normally be reached on 8:00am-5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner’s supervisor, John A. Follansbee can be reached on (571) 272-3964. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
